

## Two allocation costs and one feedback benefit

### Shared choice

#### More pilot allocation

Fixed OFDM grid

### Physical or processing link

Fewer data subcarriers;  
more known symbols

### Paired response

C: lower data fraction  
S: pilot-error proxy changes

#### Higher probe power

Communication launch  
power held fixed

Stronger sensed return;  
inter-channel interference

C: higher BER  
S: higher vibration SNR

#### Sensing-guided steering

Location estimate aligns  
illumination to receiver

C: higher estimated rate  
S: position feeds steering

Directions apply to the reported configurations, not pooled effects. The pilot-error proxy is not target error.  
Position feeds steering; separate localization tests do not establish a joint accuracy gain.
